

System Outputs/Reports

The TWM® system provides a wide range of reports that can be generated at a site specific locality or consolidated for corporate reporting requirements. The available reports include:

- Service Summary - A summary of all individual waste services
- Waste Streams Generated Report ® Reports on the weight and disposal cost associated with each waste type generated
- Contamination Reports - A breakdown of waste collected over a period comparing contaminated waste with clean waste
- Waste Statistics Report - This report provides an exact breakdown of the quantity of waste recycled, reused, disposed and contaminated over the reporting period. This report is used as the basis of waste minimization and tracks the efficiency of waste minimisation and resource recovery efforts over time.
- Waste Stream Cost Report - This report provides a breakdown for the costs of the various waste streams for the entire operation and each of the operations centres.
- Waste Register - This report provides a rating for all waste management issues in a similar way that a risk rating assesses risk to personnel and the environment. The rating in this case takes into account both the financial cost and environmental significance of each waste stream. This is calculated by taking the percentage cost of each waste for the month/quarter/half-year/year and multiplying it by the Waste Hierarchy Rating and % weight.
- Green House Gas Abatement Report - This report calculates the green house gas reductions associated with waste recycling and reuse initiatives.
- Incomplete Services - A summary of waste services that have been scheduled in the system but not completed

The TWM® system also has a receptacle stock take function which effectively maintains a waste manifest of all waste or by-products on site.
